Steel and plastic have similar casualty-report rates

The same period, component scope and matched material mileage are used in every term.

	a Report frequency per 10,000 mile-years		b Casualty share casualty / all reports		c Casualty report rate per 10,000 mile-years
Steel	0.435	×	14.1%	≈	0.061
Plastic	0.263	×	23.9%	≈	0.063

Plastic has fewer reports per mile-year and a higher casualty share among reports. The resulting point estimates are similar.
This figure shows the arithmetic identity in one cohort. Rate intervals are shown in the material comparison.
